

Connecting to a SIP Endpoint via Webex

Webex software has the capability to connect to SIP video endpoints. SIP is a standard protocol used in Internet-based Video Conferencing.

This functionality allows you to connect to Video Conferencing systems outside Cisco Webex such as Zoom, BlueJeans and others.

Please note that a SIP endpoint will need to be configured by the meeting host on the target system such as Zoom for this to work.

To connect to a SIP video endpoint, you will need a SIP address (or SIP URI). As an example, a SIP address will be in following format in the case of the NSW Justice AVL system: 10091500@justice.nsw.gov.au. This information when available is provided as an alternate connection method to connecting via a weblink.

Once you have a valid SIP address, please follow these steps to complete the connection:

1. In the Webex app, click Calling icon on the left-hand shortcut menu

2. Enter the supplied SIP address into the text area
3. Click **Video** icon to initiate the call
